Summary

## The Basic Idea:

- Two-terminal semiconductor device
- Conducts current in one direction
- Blocks current in the other direction

## Symbol and Terminals:

## Physical Device:

## Key Applications:

- Rectification (AC to DC)
- Voltage regulation
- Signal clipping and protection
- Logic circuits

Summary

The relationship between voltage and current in a diode is described by the **Shockley equation**:

$$i_D = I_S \left( e^{v_D/nV_T} - 1 \right)$$

**Parameters:**

- $i_D$  = diode current
- $v_D$  = voltage across diode
- $I_S$  = saturation current ( $\approx 10^{-14}$  A)
- $n$  = ideality factor (1-2)
- $V_T = kT/q$  = thermal voltage  
(about 25 mV at room temperature)
- $k$  = Boltzmann's constant
- $T$  = absolute temperature (K)
- $q$  = elementary charge

**Exponential Behavior:**

Current increases exponentially with voltage

# Forward Bias Operation

Introduction

Diode I-V Characteristics

Small-Signal Resistance

Zener Diodes

Lab Preview

Summary

**Forward Bias:** Positive voltage applied to anode relative to cathode ( $v_D > 0$ )

**Behavior:**

- Little current until  $v_D \approx 0.5\text{--}0.6\text{ V}$
- Current increases rapidly above this
- $v_D \approx 0.7\text{ V}$  when conducting
- Voltage stays about constant once "on"

Actual diode

Simplified model

**I-V Characteristic:**

Small voltage change  $\rightarrow$  Large current change

# Reverse Bias Operation

ECEN 222

Maxx Seminario

Introduction

Diode I-V Characteristics

Small-Signal Resistance

Zener Diodes

Lab Preview

Summary

**Reverse Bias:** Negative voltage applied to anode ( $v_D < 0$ )

**Behavior:**

- Small current magnitude
- Current  $\approx -I_S$  (saturation current)
- Typically nanoamperes (nA)
- Diode is approximated as open circuit

**From the Shockley Equation:**

For  $v_D < 0$  and  $|v_D| \gg V_T$ :

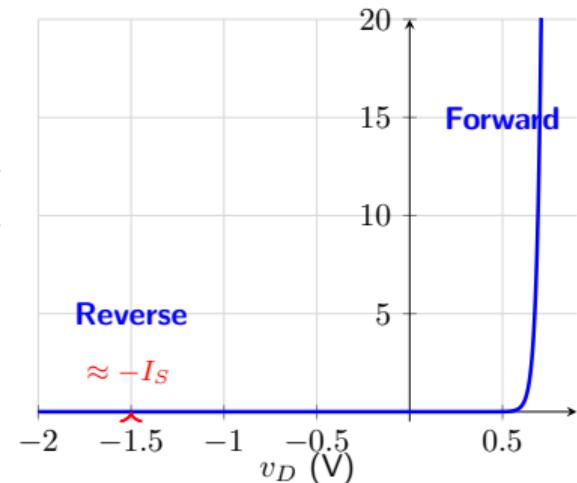

$$e^{v_D/nV_T} \approx 0$$

$$i_D \approx I_S(-1) = -I_S$$

**Warning**

Excessive reverse voltage causes breakdown and will damage diode

**Complete I-V Characteristic:**

One-way current flow

# Small-Signal Resistance $r_d$

ECEN 222

Maxx Seminario

Introduction

Diode I-V Characteristics

Small-Signal Resistance

Zener Diodes

Lab Preview

Summary

**Two types of resistance:**

**DC Resistance:**

$$R_D = \frac{V_D}{I_D}$$

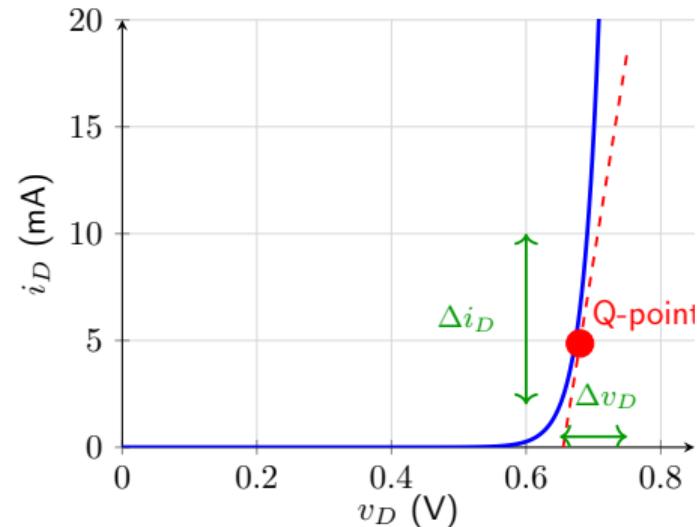

- Total voltage divided by total current

**Small-Signal Resistance:**

$$r_d = \frac{dv_D}{di_D} = \frac{nV_T}{I_D}$$

- Slope of I-V curve at operating point
- Used for small AC signal analysis
- Inversely proportional to DC current

**Visualization:**

Slope at Q-point =  $1/r_d$

# Calculating Small-Signal Resistance $r_d$

ECEN 222

Diode I-V  
Characteristics

Small-Signal  
Resistance

Zener Diodes

Lab Preview

Summary

## Formula:

$$r_d = \frac{nV_T}{I_D}$$

At room temperature with  $n = 1$  and  $V_T = 25$  mV:

$$r_d \approx \frac{25 \text{ mV}}{I_D}$$

## Examples:

$I_D$	$r_d$
1 mA	25 $\Omega$
5 mA	5 $\Omega$
10 mA	2.5 $\Omega$
100 $\mu$ A	250 $\Omega$

Higher current  $\rightarrow$  Lower resistance

## Practical Measurement:

From measurements, use:

$$r_d \approx \frac{\Delta V_D}{\Delta I_D}$$

- 1 Measure  $V_D$  and  $I_D$  at operating point
- 2 Make small change in  $V_D$
- 3 Measure new  $I_D$
- 4 Calculate  $r_d$

## Why It Matters:

- Essential for AC circuit analysis
- Determines circuit impedance
- Used in small-signal models

# Zener Diodes: Reverse Breakdown by Design

ECEN 222

Introduction

Diode I-V Characteristics

Small-Signal Resistance

Zener Diodes

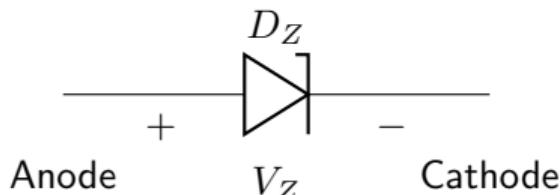

Lab Preview

Summary

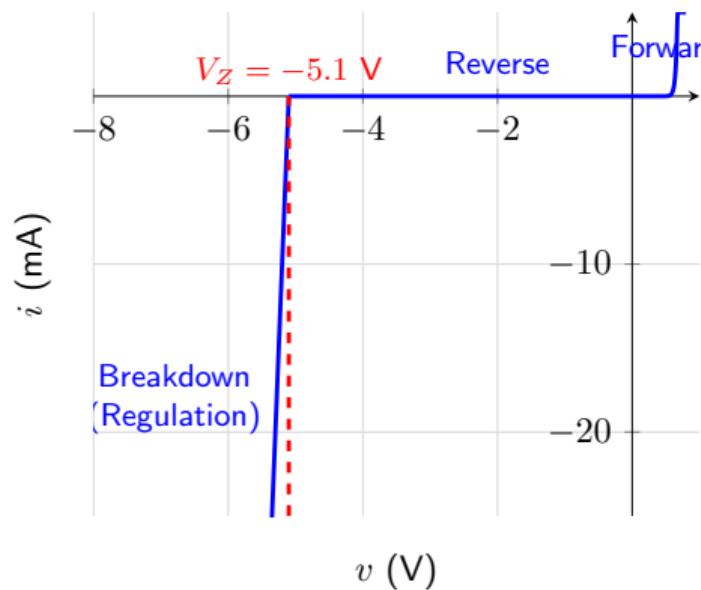

## What's Different?

- Designed to operate in reverse breakdown
- Has a specific breakdown voltage ( $V_Z$ )
- Maintains near constant voltage in breakdown
- Used for voltage regulation

## Symbol:

## I-V Characteristic:

Voltage stays near  $V_Z$  as current varies

Bent line distinguishes from regular diode

# Zener Voltage Regulation

ECEN 222

Maxx Seminario

Introduction

Diode I-V Characteristics

Small-Signal Resistance

Zener Diodes

Lab Preview

Summary

## Simple Voltage Regulator:

### Operation:

- $V_{in}$  must be greater than  $V_Z$
- Zener maintains  $V_{out} \approx V_Z$
- Works even if  $V_{in}$  or  $I_L$  varies
- Series resistor  $R$  limits current

## Zener Model in Breakdown:

Zener model

$$V_{actual} = V_Z + r_z \cdot I_Z$$

## Small-Signal Resistance ( $r_z$ ):

- Smaller  $r_z$  = better regulation
- Measure as  $r_z = \Delta V_Z / \Delta I_Z$

## Important

$P_Z = V_Z \times I_Z$  must be within power rating

# What You'll Do in Lab

ECEN 222

Maxx Seminario

Introduction

Diode I-V  
Characteristics

Small-Signal  
Resistance

Zener Diodes

Lab Preview

Summary

## Experiment 1: Forward Bias

- Measure I-V characteristics
- Observe exponential behavior
- Identify turn-on voltage

## Experiment 2: Small-Signal Resistance

- Calculate  $r_d$  from measurements
- Verify theoretical predictions
- Compare at different operating points
- Understand slope of I-V curve

## Experiment 3: Reverse Bias

- Measure reverse current
- Verify saturation current behavior
- Understand one-way conduction

## Experiment 4-5: Zener Diodes

- Measure breakdown characteristics
- Determine Zener voltage
- Calculate Zener resistance  $r_z$
- Verify voltage regulation

# Summary: Diode Fundamentals

Summary

## Key Concepts:

- Diodes are one-way current devices
- Forward bias: conducts at  $\approx 0.7 \text{ V}$
- Reverse bias: blocks current ( $\approx -I_S$ )
- Exponential I-V relationship

## Important Equations:

- Shockley:  $i_D = I_S(e^{v_D/nV_T} - 1)$
- Small-signal:  $r_d = nV_T/I_D$
- Thermal voltage:  $V_T \approx 25 \text{ mV}$

## Zener Diodes:

- Operate in reverse breakdown
- Maintain constant voltage  $V_Z$
- Used for voltage regulation
- Model:  $V_Z + \text{small resistance } r_z$

## Next Topics:

- Diode circuit analysis
- Rectifier circuits (AC to DC)
- Bridge rectifiers

## Prepare for Lab

Review Shockley equation, understand forward/reverse bias, and complete pre-lab questions
